

# Near optimal design and operation of clustered buildings in cities, a top-down ready bottom-up approach

Workshop District Heating  
28/11/2023

# District heating networks in Flanders

# DHN's in Flanders the current state

- Mixed DHN
- Domestic DHN
- Non-domestic DHN

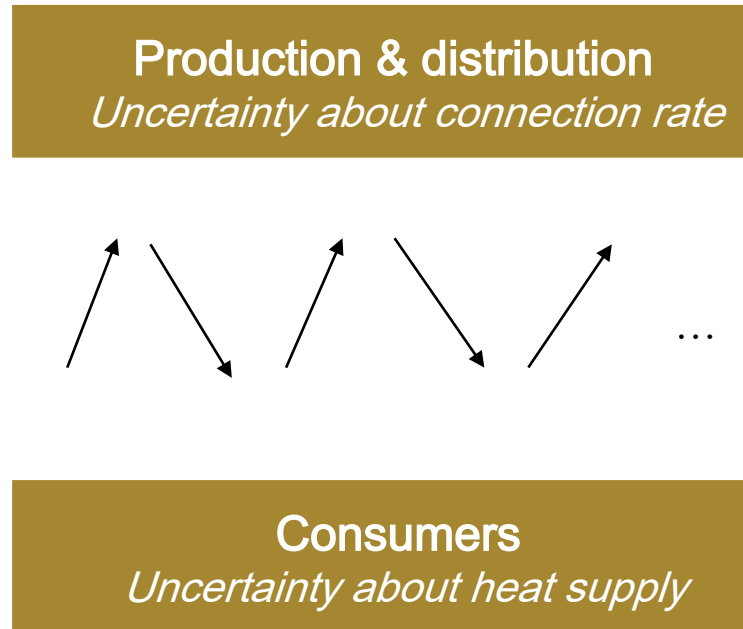

Share of heat use per DH type

→ Only a small number of households is served by a DHN

# Although...

# Key actors are waiting for each other

# Inputs from multiple collaborations and real projects in practice and research

Integrated fossil free design of building and building services

# Highways, Waterways & Lightrail

# Energy

# Industry

# Regional Infrastructure

# Risk mitigation using technical solutions

# Near optimal design and operation of clustered buildings in cities, a top-down ready bottom-up approach

Divide the challenge at the demand side into smaller sub-assignments

*District-level, group of households (when possible clustered with other functionalities in the neighborhood)*

# Near optimal cities, a

50 households

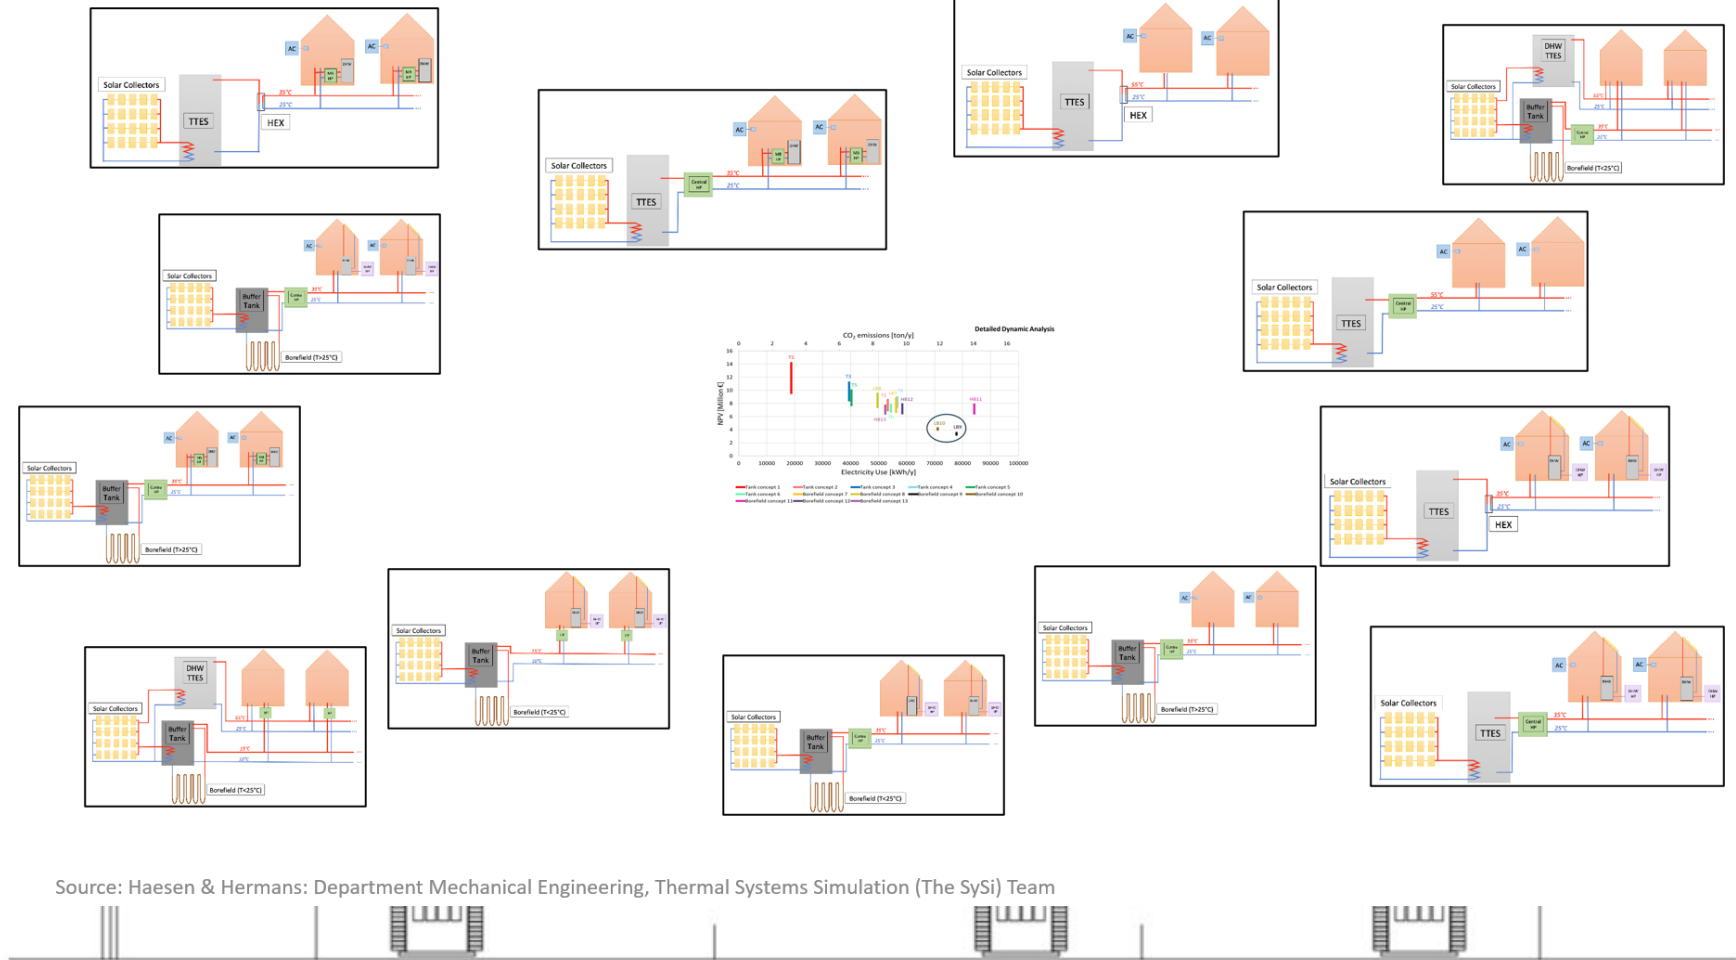

Optimization of design and operat

- Design: combination of heat so  
*Ground, water, air, residual heat*
- Operation: smart control (KULeuven  
*RBC, MPC*)

Maintaining flexibility for optimization  
*Plug 'n play*

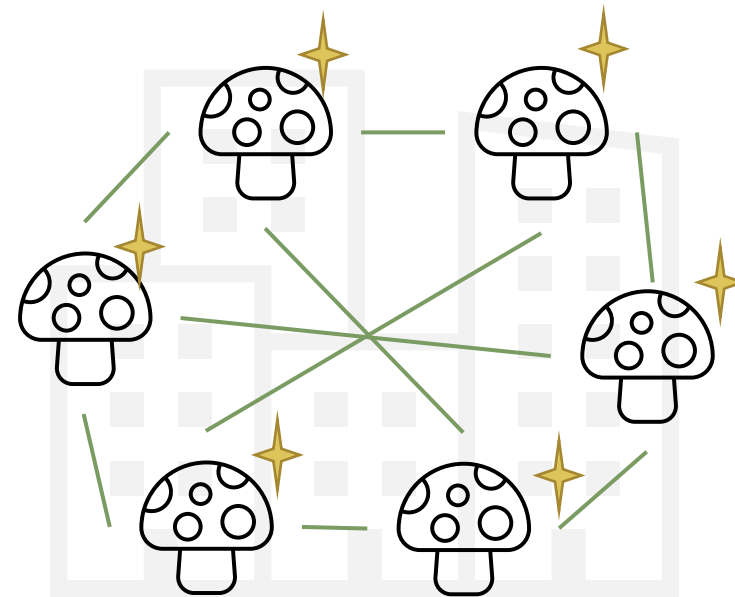

What is de the perfect size of a cluster

# Near optimal design and operation of clustered buildings in cities, a **top-down ready bottom up approach**

Connection of optimized clusters instead of separate households

- ✓ Risk mitigation
- ✓ No need to wait:
  - Ready for **starting today**
  - Smooth **integration in a future** larger (city scale) thermal grid
- ✓ Optimal use of available heat sources for the city

# Cluster optimization test case: “De Schipjes”

*The historic center medieval  
Bruges*

# Almshouses 'the Schipjes'

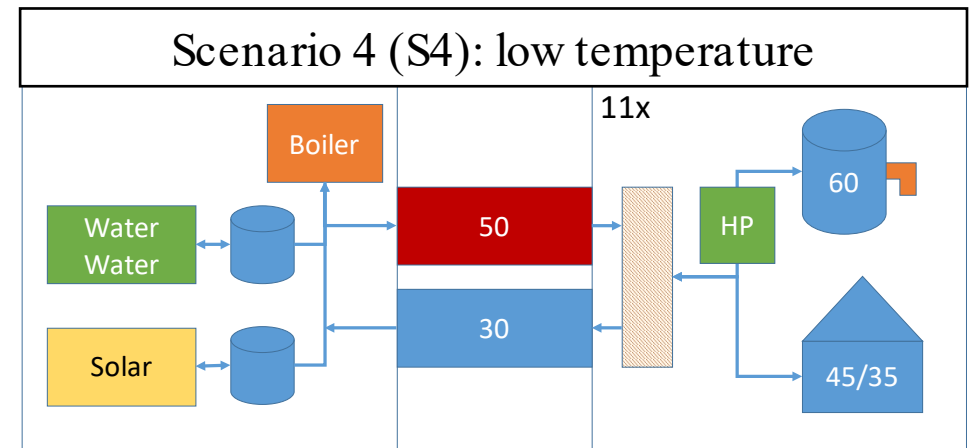

*VLAIO "proeftuin" living lab 2014-2019*

- 11 small houses (1907) in the historic city center of Bruges (BE)
- Energetical upgrade & retrofit of the historical site (building & technical performance) without a gas boiler using simulations

# Thermal network scenario analysis

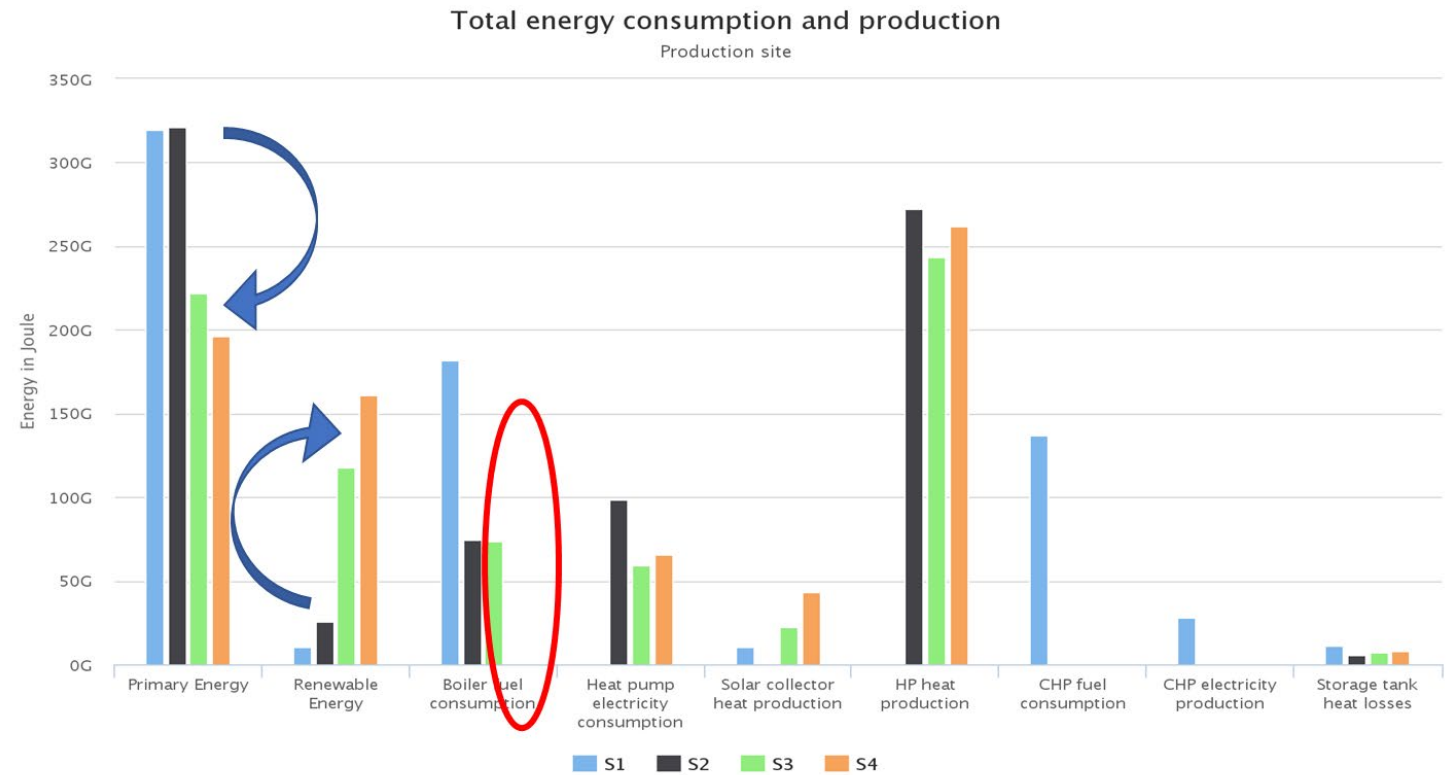

# Performance based configuration of hybrid systems

From scenario analysis & based on simulations:

- Centralized GSHP
  - Centralized solar collector
  - Individual boosters
  - Later: air source heat pump
- System integrated design

**Hybrid** (multiple renewable technologies) **collective systems** make decarbonisation feasible and affordable

Highcharts.com

# Way forward

- HeriTACE
- SEEDS

# The horizon SEEDS project: towards an optimized residential cluster

1. Optimized **sizing** of hybrid systems
  2. Optimized system integration through model predictive **control** (MPC)
  3. **Hydronic scheme** switch frame to further optimize operation and performance
- joint research and methodology development approach by partners KU Leuven & SwecoBE

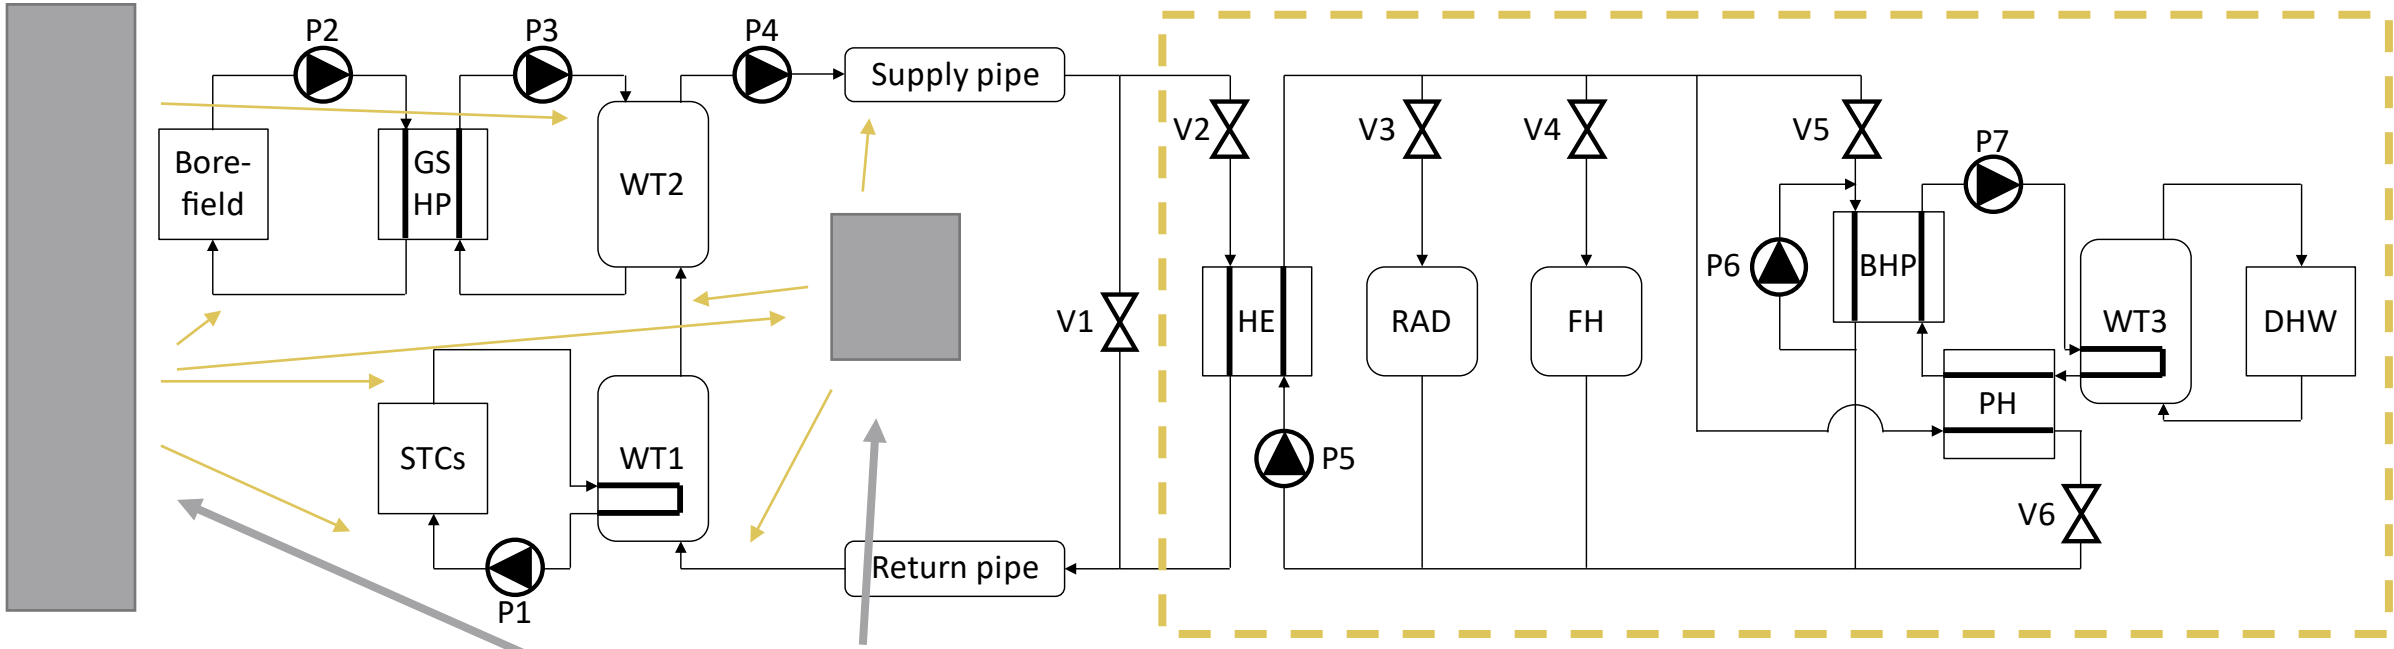

# Optimized system integration through model predictive control (MPC)

Source: D. Picard & F. Jorissen 2021, Builtwins

# Hydronic scheme switch, flexible operation of supply

x12

- BHP: Booster heat pump
- FH: Floor heating
- GSHP: Ground sourced heat pump
- HE: Heat exchanger
- PH: Preheater
- RAD: Radiators
- STC: Solar thermal collector
- WT: Water tank

Add ASHP,  
 Make multiple connections for different seasons in backbone scheme  
 switch, enrich variations and scenarios  
 Dynamic hydronics, feedback to models, ...  
 Explore MPC as scheme switcher

# Extrapolation opportunities

## Replication of DeSchipjesconcept to other residential districts in Europe

### Demonstrated solution for historic buildings

- Highly replicable in historic city centers all over Europe
- Highly replicable when the energy mix is strongly dependent on Russian fossil fuel supplies
- Highly replicable in whatever district (since proven for the most difficult case)

# Thanks for listening!
